

Thermal Interaction Web

This is a static single-page website for exploring thermal interaction research papers using interactive filters and a body-map visualisation.

There is no backend server. Everything runs locally in the browser.

Opening the website locally

To open the website on your computer, Node.js and npm are required. No IDE or code editor is required.

1. Install Node.js

Please install the current LTS version of Node.js from nodejs.org.

After installing Node.js, you can check that it is available by opening a terminal and running:

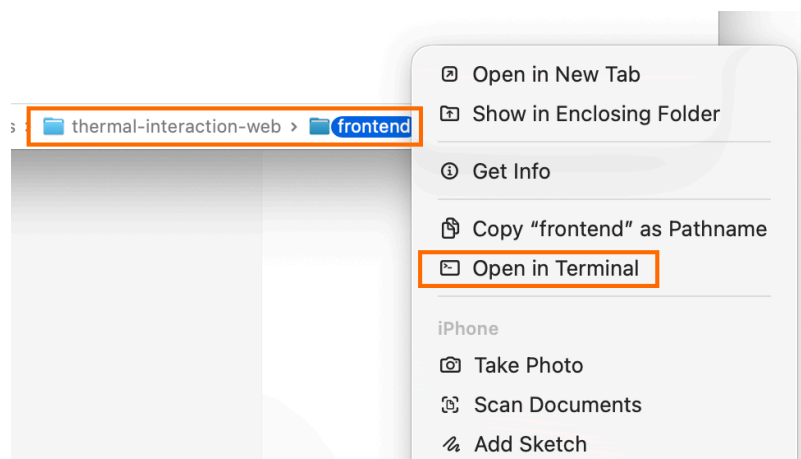

```
node -v
npm -v
```

Recommended versions:

Tool	Version
Node.js	20.19+ or 22.12+
npm	10+

2. Open a terminal in the frontend folder

On macOS:

1. Open the unzipped project folder in Finder.
2. Right-click the `frontend` folder.
3. Select `Open in Terminal`.

On Windows:

1. Open the unzipped project folder.
2. Open the `frontend` folder.
3. Click the address bar at the top of File Explorer.
4. Type `cmd` and press Enter.

After this, the terminal should be opened in the correct `frontend` folder.

If `Open in Terminal` is not shown on macOS, open Terminal manually and run. For example, if the project is in the Downloads folder, run:

```
➤ cd ~/Downloads/thermal-interaction-web/frontend
```

If the project folder is somewhere else, please adjust the path accordingly.

3. Install the required packages

Run:

```
➤ npm install
```

This may take a few minutes the first time.

4. Start the website

Run:

```
➤ npm run dev
```

5. Open the website in your browser

After the command starts successfully, the terminal will show a local URL, usually:

```
http://localhost:5173
```

Open this URL in your browser.

The website should then be available locally on your computer.

Developer commands

All commands should be run from the `frontend` folder.

Command	Description
<code>npm run dev</code>	Start the local development server
<code>npm run build</code>	Typecheck and create the production build
<code>npm run preview</code>	Preview the production build locally
<code>npm run lint</code>	Run ESLint

Troubleshooting

Node.js version warning

If installation fails or Vite shows a Node.js warning, please install a newer LTS version of Node.js.

The recommended versions are Node.js 20.19+ or 22.12+.

Port already in use

If port `5173` is already being used, Vite may open the website on another port.

Please use the URL shown in the terminal.
